

01 Web88

(Web Content Management System)

Web88 is a Web Content Management System (WCMS). Web88 is implemented as a Web application, for creating and managing content. It is used to manage and control a large, dynamic collection of Web material (HTML documents and their associated images). A WCMS facilitates content creation, content control, editing, and essential Web maintenance functions.

The software provides authoring (and other) tools designed to allow users with little knowledge of programming languages or markup languages to create and manage content with relative ease. Administration is done through browser-based interfaces. Unlike Web-site builders, Web88 allows non-technical users to make changes to a website with little training.

Business Benefits

1. Easily editable content

Web88 software includes WYSIWYG editing tools or FCKeditor allowing non-technical individuals to create and edit content.

2. Scalable feature sets

Include modules that can be easily installed to extend an existing site's functionality.

3. Automated pages

Create standard output pages that can be automatically applied to new and existing content, allowing the appearance of all content to be changed from one central place.

4. Delegation

Allow for various user groups to have limited privileges over specific content on the website, spreading out the responsibility of content management.

5. Upload and sharing

Easily upload and share Images, Video and Audio for others to view and leave comments on. Media items can also be added from external sources, such as YouTube.
